Problem 2: Array Transformation Cost Minimization

You are given an integer array **A** of size **N**. You can perform the following operation any number of times:

- Choose any index **i** and replace **A[i]** with **A[i] + K** or **A[i] - K**, where **K** is a fixed integer.

Your goal is to:

- Transform the array such that **all elements become equal**.
- Return the **minimum total number of operations required**, or **-1** if it is not possible.

🔹 Input Format:

- First line: Integer **N**
- Second line: N space-separated integers (array A)
- Third line: Integer **K**

🔹 Output Format:

- Print minimum number of operations or **-1**

🔹 Constraints:

- $1 \le N \le 10^5$
- $1 \le A[i], K \le 10^9$

🔹 Example:

Input:

```
5
2 4 6 8 10
2
```

Output:

```
6
```

🔹 Explanation:

Convert all elements to 6:

- 2 → 6 (2 steps)
- 4 → 6 (1 step)
- 6 → 6 (0 steps)
- 8 → 6 (1 step)
- 10 → 6 (2 steps)

Total operations = **6**
